

GCI Power Tools for OpenText Content Server

Designed to help organizations better manage their information and content lifecycles, GCI Power Tools provide business critical extensions to the OpenText Content Server platform.

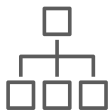

Organizations in industries such as Life Sciences, Energy and Finance use GCI Power Tools to help them automate document creation, deliver regulated document workflows and reports and migrate and archive content in a robust and scalable manner.

GCI Power Tools for Deployments

In addition to developing new content, moving that content to your various Content Server instances can be a challenging process. It often involves moving content from a development environment to a testing environment and then on to the production environment. Alternatively, it may mean merging disparate instances into one.

GCI Power Tools for Deployments solves this problem by enabling the export of an entire product object structure (or selected components) into a set of XML files and then moving them into the target environment, recreating the entire structure in the Content Server instance. The references between all the imported objects and the references to the system users and permissions are all maintained.

GCI Power Tools for Workflow

GCI Power Tools for Workflow is a collection of advanced extensions for Content Server workflows. Through the use of Power Tools for Workflow it is possible to enhance the workflow user experience, perform actions on repository content and provide step auto-completion or escalation.

In addition, powerful event handling capabilities enable the initiation of workflows in response to content being created or modified within your Content Server repository.

GCI Power Tools for Documents

GCI Power Tools for Documents is a configurable, easy-to-implement solution for automating document processing within Content Server. It supports production automation, flow, sharing and digital signing of documents of any type, including technical, marketing, commercial and legal.

With Power Tools for Documents, you can easily merge documents of several formats, build standardized content, authorize them to flow into your extended enterprise and associate them with your business workflows.

GCI Power Tools Viewer

The GCI Power Tools Viewer allows OpenText Content Server users to view and collaboratively annotate documents of many formats, including Office documents, Open Office, PDF, images and CAD.

To help you readily locate your pictures and documents, Power Tools Viewer also provides thumbnail views on any standard folder with just the click of a mouse.

GCI Power Tools for Reports and Views

GCI Power Tools for Reports and Views adds the ability to create custom interfaces and dashboards within Content Server. Using programming standards such as HTML, XML, XSL and JavaScript, Power Tools for Reports and Views provides a comprehensive and flexible reporting solution that can be used to deliver reports to business managers worldwide.

GCI Power Tools for OpenText Electronic Signatures™

The OpenText Electronic Signatures module has become the OpenText Content Server workflow standard for regulated industries requiring electronic signatures that meet compliance standards such as FDA 21 CFR Part 11.

GCI Power Tools for OpenText Electronic Signatures enhances the capabilities of this module, adding the ability to sign, convert and watermark multiple documents within the same workflow, as well as providing a more seamless integration with the common business processes of companies in highly regulated industries.

GCI Power Tools for Content Export

GCI Power Tools for Content Export facilitates the extraction of documents and metadata from Content Server in a format that can be distributed to clients, regulators and other stakeholders.

For example, a Contract Research Organization (CRO) or a Pharmaceutical Services Company could easily aggregate their scientific findings and results and prepare them for delivery, further extending the value they provide to their clients. Downloading the collection and its metadata in an intact XML file can facilitate the delivery of such a collection.

GCI Power Tools for Archiving

Eliminate legal liabilities and improve the performance of your Content Server by properly archiving complex content such as completed workflows and audit information.

GCI Power Tools for Archiving is the only solution that truly archives objects such as completed workflows and audit trail information, allowing you to eliminate them from your database tables, thus unclogging your Content Server database and increasing its performance. By allowing archived objects to be put under records management retention and disposition, Power Tools for Archiving also helps to reduce the risks associated with litigation.
